

# **Continuous Data Production**

## **Pilot Project at WSC**

*Francois Rainville*

*September 2018*

# Hydrometric monitoring is in transition

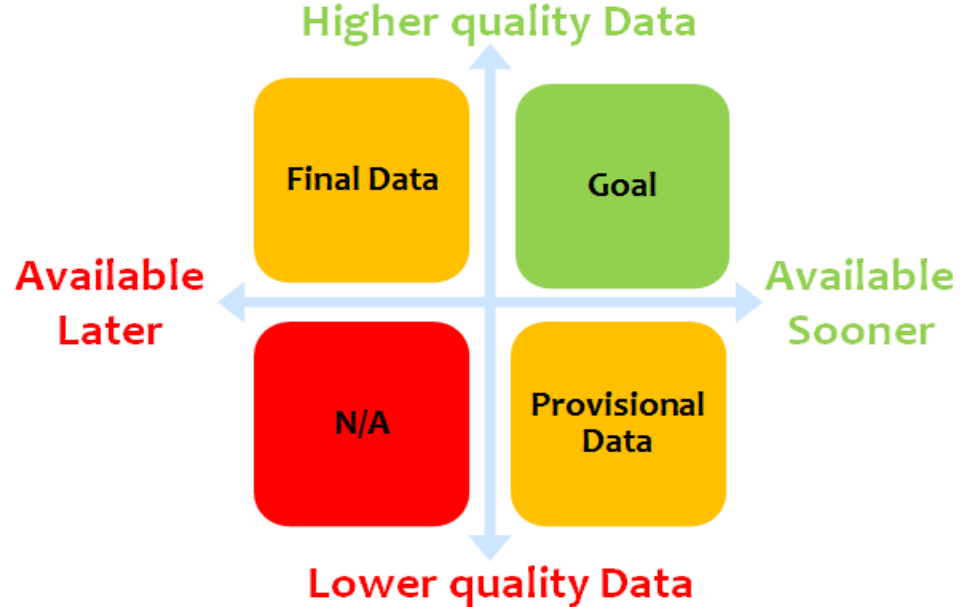

Procedures must evolve

# Worldwide, real-time is often equated with quick display of telemetry data:

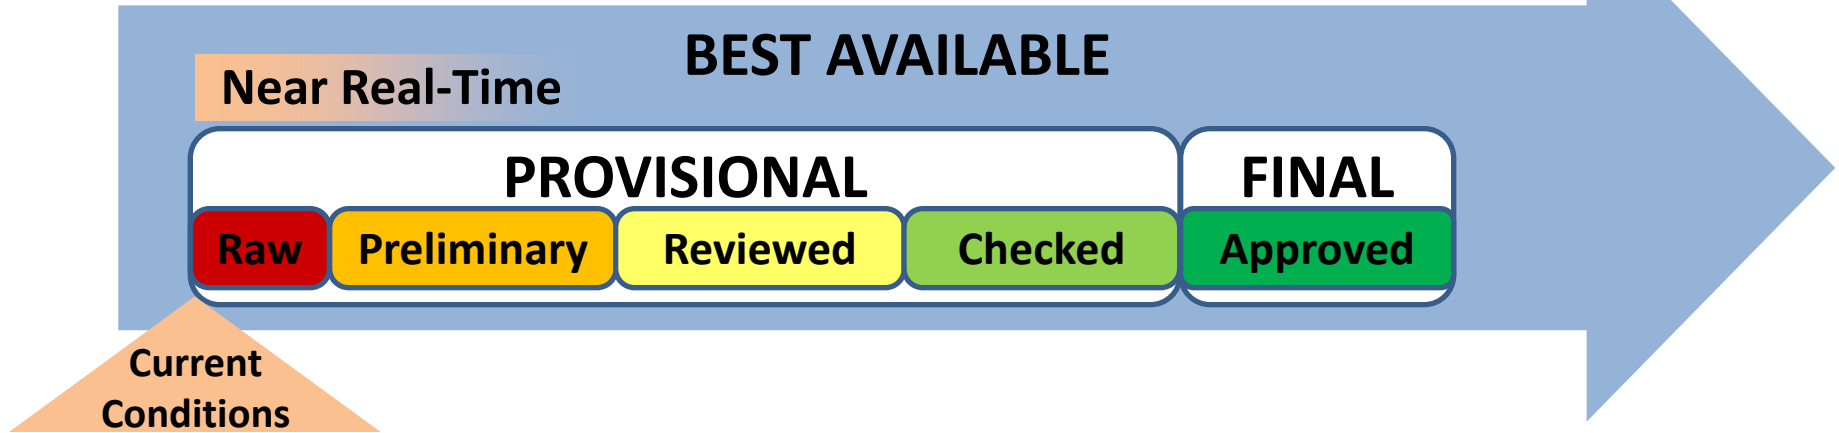

- No process to accelerate quality control
- No standard for minimum acceptable quality

**WSC wishes to redefine its production to provide better data faster**

**Timeliness**

**Completeness**

### **Current Conditions**

- Conditions right now

### **Near Real-Time**

- Data published right after their acquisition

### **Best Available**

- Data as accurate as possible at any given time

### **Continuous Data Production**

- Processes through which data are made as accurate as possible at any given time

# Continuous Data Production Pilot

The Pilot started in June 2018.

Its objectives are to:

- 1) Define a process standard across all WSC
  - Solutions tested in 3 locations during all seasonal/operational changes
- 2) Assess costs and benefits
  - The goal is to be cost neutral to partners

Some of questions we hope to answer:

- Should data always be displayed regardless of quality?
- How should production adapt to events and stations?
- What field/office strategies could improve timeliness or efficiency?

# The Pilot Teams

Located in 3 different offices:

1. Cranbrook, BC / 1 supervisor + 3 techs
2. Winnipeg, MB / 1 supervisor + 4 techs
3. Ottawa, ON / 1 supervisor + 5 techs

Coordination done by Headquarters:

- Modified procedures, Support tools, Performance metrics
- The 3 teams share progress through biweekly meetings

*Contact A. Bouchard, C. Thomson, S. Moore, G. Walker  
or F. Rainville for details on pilot.*

# Pilot participants are asked to:

- 1) Apply results from site visits as soon as possible
  - Communicate electronic survey notes from the field
  - Share responsibilities to apply field results in a timely manner
- 2) Manage site conditions early and regularly
  - Use dashboard to track priorities and actions taken
  - Interpret and modify data as events occur
- 3) Optimize efforts to minimize validation/approval efforts
  - Modify review responsibilities to reduce redundancies

# New Ways to Share Responsibilities

Data computation is a team responsibility for Pilot stations!

- Techs in the field must:
  - Capture results on electronic survey notes
  - Review results
  - Communicate results via Google Drive
- Techs in the office must:
  - Monitor their stations and stations assigned for techs in the field regularly (eyes-on-data)
  - Upload and apply field visit results when communicated
  - Peer review the application of field visit results on their stations

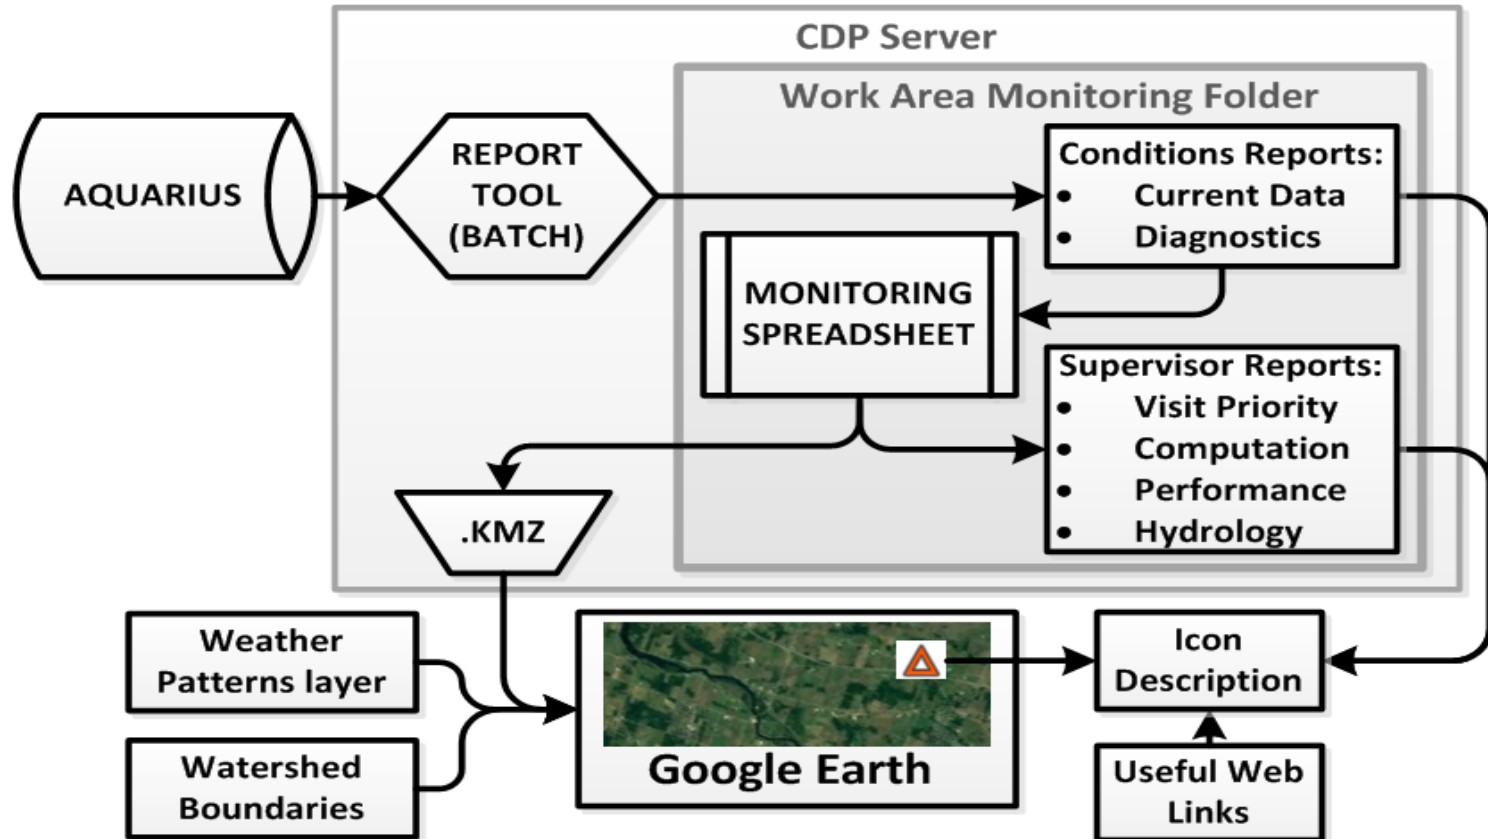

# New Ways to Monitor Stations

A dashboard was built to track eyes-on-data and its conclusions. It is a sandbox to experiment with new workflows and methods.

- Station monitoring spreadsheet
  - Excel files track data and health info, to set priorities for problems detected.
- WSC data computation system
  - AQUARIUS remains the place to compute data.
- Google Earth
  - Station info in context to help dispatch resources during crisis.
- Summary reports
  - Produced automatically, helps review data in minutes.
- Server space
  - All CDP information is managed in dedicated server space.

# Dashboard General Concept

Battery Voltage (V) last 6 Months

Tank Pressure (Psi) last 12 months

Past 8 days HG(black) and HG2(red) Data

Rating(HG(m) against  $Q(m^3/s)$ )

Gauge Height (m) last 8 days

Discharge ( $m^3/s$ ) last 8 days

# 02LB006 CASTOR RIVER AT RUSSELL 2018-09-18

Discharge ( $m^3/s$ ) since start of 2018

## 02LB008 BEAR BROOK NEAR BOURGET 2018-09-18

Current Values	
Voltage(V)	12.2
Tank Pressure(Psi)	1641.4
Signal(dBm)	-
Forward Power(W)	-
Reflective Power(W)	-

- Longer trends are assessed.
- Data not equally available.

02LB008 BEAR BROOK NEAR BOURGET

Station Output:

Station Costs:

Service Level: Normal

Station Health: Station OK or No Status

Hydrological Conditions: No Event or No Status

Recommended Visit Priority: High

(Reported by: CMP)

(Last Update: 17/09/2018)

Additional Station Monitoring Comments:

need a new N2 tank and keep an eye on the battery as it seems to be holding a new trend in the past month

Image Landsat / Copernicus

# More automations are desired

-  Quickly process field results
-  Guide validation  
(Alerts to focus interventions)
-  Apply corrections  
(Range, spikes, offsets)

New WSC procedures emphasize need to adopt automated processes, either for validation, correction or estimation.

Methods such as “Machine Learning” are also assessed to automate rating development and associated shifts.

# Next steps

- Measure changes in computation performance  
(e.g. Time from visit/problem to data correction)
- Identify factors influencing efforts at any station  
(When does a station require more attention?)
- Prepare for more complex periods  
(How to provide better data faster during estimations?)
